

Ch 7.3 Gauss-Seidel Iteration

In Ch 2, we learned how to solve $f(x)=0$ using fixed-point iteration for a suitably chosen $g(x)$ and initial guess $x=x_0$.

In these notes we briefly see how fixed point iteration can be used to solve a system of linear equations.

Example Consider the system below, whose solution is (1,1).

$$\begin{cases} 10x - 2y = 8 \\ -3x + 12y = 9 \end{cases} \quad \left. \begin{array}{l} \text{Diagonally-dominant system, because} \\ a_{11}=10 \text{ \& } a_{22}=12 \text{ are relatively large.} \end{array} \right\}$$

① Solve r_1 for x and r_2 for y :

$$x = g_1(y) = \frac{8+2y}{10}$$

$$y = g_2(x) = \frac{9+3x}{12}$$

② Iterate as follows:

$(x_0, y_0) = \text{initial guess}$

$$(x_1, y_1) = (g_1(y_0), g_2(x_1))$$

$$(x_2, y_2) = (g_1(y_1), g_2(x_2))$$

\vdots

$$(x_n, y_n) = (g_1(y_{n-1}), g_2(x_n))$$

The iterates $(x_n, y_n) \rightarrow (x, y) = \text{solution of system of equations}$ for diagonally-dominant systems. These systems commonly occur for partial differential equations (multivariate equations with derivatives).

③ Perform iteration out to $n=2$, using $(x_0, y_0) = (0, 0)$

$$10x - 2y = 8 \quad \Rightarrow \quad x = g_1(y) = \frac{8+2y}{10}$$

$$-3x + 12y = 9 \quad \Rightarrow \quad y = g_2(x) = \frac{9+3x}{12}$$

$$x_0 = 0$$

$$y_0 = 0$$

$$x_1 = g_1(y_0) =$$

$$y_1 = g_2(x_1) =$$

$$x_2 = g_1(y_1) =$$

$$y_2 = g_2(x_2) =$$

21	$x_0 = 0$	<input type="text" value="0"/>
22	$y_0 = 0$	<input type="text" value="0"/>
23	$x_1 = g_1(y_0)$	<input type="text" value="0.8"/>
24	$y_1 = g_2(x_1)$	<input type="text" value="0.95"/>
25	$x_2 = g_1(y_1)$	<input type="text" value="0.99"/>
26	$y_2 = g_2(x_2)$	<input type="text" value="0.9975"/>
27	$x_3 = g_1(y_2)$	<input type="text" value="0.9995"/>
28	$y_3 = g_2(x_3)$	<input type="text" value="0.999875"/>
