<u>Trigonometric Substitution</u>: The goal for trigonometric substitution is to eliminate the radical in the integrand and rewrite it in the form of a trigonometric expression. Let a > 0,

1. For integrals involving
$$\sqrt{a^2 - u^2}$$
 $\det u = a \sin \theta$. Then
$$\sqrt{a^2 - u^2} = a \cos \theta, \text{ where } -\frac{\pi}{2} \le \theta \le \frac{\pi}{2} \text{ why?}$$

$$u = a \sin \theta \qquad \int a^2 - (a \sin \theta)^2 = \sqrt{a^2 - a^2 \sin^2 \theta}$$

$$= \sqrt{G^2 (1 - \sin^2 \theta)}$$

$$= \sqrt{a^2 \cos^2 \theta}$$

$$= a \cos \theta$$

2. For integrals involving $\sqrt{a^2 + u^2}$, let $u = a \tan \theta$. Then

$$\sqrt{a^2 + u^2} = a \sec \theta$$
, where $(\frac{\pi}{2} \le \theta \le \frac{\pi}{2})$ Why?

$$u = \alpha \tan \theta$$
 $\sqrt{\alpha^2 + (\alpha \tan \theta)^2} = \sqrt{\alpha^2 (1 + \tan^2 \theta)}$

$$= \sqrt{\alpha^2 \sec^2 \theta}$$

3. For integrals involving $\sqrt{u^2 - a^2}$, let $u = a \sec \theta$. Then

$$\sqrt{u^2 - a^2} = \begin{cases} a \tan \theta, & \text{for } u > a, \text{ where } 0 \le \theta \le \frac{\pi}{2} \\ -a \tan \theta, & \text{for } u < -a, \text{ where } \frac{\pi}{2} \le \theta \le \pi \end{cases}$$
Why?

$$h = a \sec \theta \sqrt{(a \sec \theta)^2 - a^2} = \sqrt{a^2 (\sec^2 \theta - 1)}$$

$$= \sqrt{a^2 \tan^2 \theta}$$

$$= a \tan \theta$$

Notice that these are the same intervals over which arcsine, arctangent, and arcsecant are defined. This ensures one-to-one.

Ex: Integrate the following:

$$a) \int \frac{-12}{x^2 \sqrt{4-x^2}} dx$$

b)
$$\int \frac{\sqrt{x^2 - 9}}{x} dx$$

$$c) \int \frac{x^3}{\sqrt{4+x^2}} dx$$

Ex: Integrate the following:

a)
$$\int \frac{-12}{x^2 \sqrt{4 - x^2}} dx$$
